## EXECUTIVE SUMMARY

This report presents the first results from a project to produce and analyse detailed demographic statistics for the historic counties of the UK. Enumerating statistics for the counties enables:

- Studies of population and other demographic indicators across decades and centuries on the fixed geographical reference frame over which our history has been played out;
- The presentation of important contemporary national statistics on a set of units which are familiar to the public and which conform to commonly held notions of community and identity.

Population: The historic counties are diverse in size and population. Yorkshire $(5,218,838)$ has the largest population, a factor of 738 that of Cromartyshire $(7,074)$ which has the smallest. Middlesex (14,038/sq mile) has the highest population density, a factor of 2,228 that of Sutherland ( $6 / \mathrm{sq}$ mile) which has the lowest. The highest population densities are seen in the home counties (especially Middlesex, Surrey, Kent, Essex and Hertfordshire); in the west and north midlands (Warwickshire, Worcestershire, Staffordshire and Cheshire); in Lancashire; in south Wales (Glamorgan, Monmouthshire); and in the central belt of Scotland (especially Renfrewshire and Midlothian). The counties with the lowest population densities are found in the south and north of Scotland and in mid and west Wales. The 6 counties of Northern Ireland have population densities within the median range of that found throughout the UK.
A comparison between the 1901 and 2011 Censuses (for England and Wales) shows how remarkably small the relative changes in population density between the counties have been. The population of Middlesex increased by a factor of 1.12 between 1901 and 2011. This small increase and the slightly larger increases in Surrey (1.48) and Kent (2.04) suggest that the greenbelt around the metropolis is significantly restricting population growth in this area. This contrasts with the huge growth of population seen in other counties in south-east England. In 5 counties (Buckinghamshire, Hertfordshire, Huntingdonshire, Bedfordshire and Berkshire) the population has more than tripled in 110 years. Whilst Cheshire's population has grown by a factor of 2.05 and Yorkshire's by 1.46, in other northern counties population growth has been modest: Westmorland (1.36), Northumberland (1.32), Durham (1.24), Cumberland (1.15) and Lancashire (1.12). The most significant population growth in Wales is in Flintshire (2.64) and Denbighshire (1.75), undoubtedly due to $20^{\text {th }}$ century industrial development alongside the River Dee. There has also been significant population growth in Monmouthshire (1.76) and Glamorgan (1.54). In the other Welsh counties population growth has been modest.

Gender: The Male:Female ratio varies from Shetland (M50.8\% : F49.2\%) to Buteshire (M47.8\% : F52.2\%). Age Structure is a big factor in this: Buteshire has the largest percentage of Over 64yos. Migration tends to consist of younger people, which may partly explain the relatively low percentage of females in counties such as Cambridgeshire (50.2\%) and Bedfordshire (50.3\%).

Marital Status: The counties with the highest percentage in the 'Married' category (Kinross-shire $60 \%$, Peeblesshire $56 \%$ ) are predominantly rural with older populations. The counties with the lowest 'Married' percentages (Middlesex 39\%, Lanarkshire 39\%) are more urban with younger populations. The percentage in the 'Widowed' category varies between 5\% (Middlesex, Surrey) up to $12 \%$ (Buteshire) and is closely linked to the Age Structure in each county. The percentages in the 'Divorced' category are lower in the 6 counties of Northern Ireland than in any other county.
Age Structure: There is a clear trend for the mean age to be lowest in the home counties, the southern midlands, Yorkshire, Lancashire, in South Wales (Glamorgan and Monmouthshire) and in the central belt of Scotland (Lanarkshire, West Lothian, Midlothian). Mean age tends to be higher in south-west England, in north and west Wales, in southern Scotland and along the west and north of Scotland. All 6 counties of Northern Ireland have mean ages among the lowest in the UK. The counties with the highest population densities tend to have the lowest mean ages.

Ethnic Group: There are 63 counties in which more than $95 \%$ of the population are in the 'White' Ethnic Group, including all 6 in Northern Ireland, all in Wales apart from Glamorgan and all but 4 in Scotland. The counties with the largest percentages in other Ethnic Groups tend to be located around major population centres especially in the home counties, in the midlands of England, in Yorkshire, in Lancashire and in the central belt of Scotland. The counties with the lowest percentages in the 'White' Ethnic Group are Middlesex (58\%), Surrey (73\%) and Essex (76\%), reflecting the ethnically diverse nature of the metropolitan parts of these counties.

General Health: Counties in Scotland tend to have among the highest percentages in the 'Very Good / Good' category - more than $80 \%$ in most Scottish counties. In England, southern counties tend to have the highest percentages for this indicator. This is more than $83 \%$ in a contiguous group of 9 counties (Huntingdonshire, Cambridgeshire, Hertfordshire, Middlesex, Surrey, Berkshire, Buckinghamshire, Oxfordshire and Wiltshire). The 6 counties of Northern Ireland generally have lower percentages in the 'Very Good / Good' category than England. In south and mid Wales are a group of counties with the lowest 'Very Good / Good' percentages in the UK, alongside Durham. The 'Bad/Very Bad Health' category reinforces these conclusions, 6 counties having a percentage of more than 7\%: Durham, Carmarthenshire, Glamorgan, Monmouthshire, Brecknockshire and Lanarkshire, all former coal mining counties. Whilst theories about the correlation between disadvantage and health may explain some of this effect, the more direct effects of working in the mining industry probably also continue to affect health in these counties.

Country of Birth: The results make clear the concentration of recent immigration to the UK within the south-east of England: in Middlesex only 56\% of the population was born in England and 40\% of it was born outside the Common Travel Area (CTA, i.e. UK, ROI, Channel Islands, Isle of Man). Bedfordshire (79\%), Buckinghamshire (78\%), Essex (79\%) and Surrey (71\%) also have low percentages born in England. In all other English counties, more than $80 \%$ of the population was born in England. In contrast, in no Welsh county was more than $80 \%$ of the population born in Wales. In 5 Welsh counties less than $60 \%$ of the population was born in Wales. This is accounted for by the high percentage of the population who were born in other parts of the CTA. This is more than half of the population in Radnorshire (56\%) and Montgomeryshire (52\%) and more than a third of the population in Flintshire (45\%), Cardiganshire (39\%) and Merionethshire (38\%). The percentage in each Scottish county born in Scotland varies from 67\% (Berwickshire) up to 89\% (Dunbartonshire). In 26 Scottish counties more than 10\% of the population were born elsewhere in the CTA. The percentage from outside the CTA is generally much smaller than this. Only in Aberdeenshire and Midlothian is this more than $10 \%$. In all 6 of the counties of Northern Ireland over $83 \%$ of the population were born in Northern Ireland. The percentage in each county from the rest of CTA is $6-11 \%$ and the percentage from the rest of the world is $4-6 \%$.
Welsh Language Skills: the 2011 Census shows that the percentage of Welsh speakers in the Welsh speaking heartlands (Merionethshire, Anglesey, Caernarfonshire, Cardiganshire and Carmarthenshire) is between $40 \%-60 \%$. Elsewhere the percentage is less than 22\%: from Monmouthshire (9\%) to Montgomeryshire (21\%). A comparison between the 1911 and the 2011 Censuses shows a huge decline in the percentage of Welsh speakers in most counties, even in the heartlands. For example, $85 \%$ of the population of Carmarthenshire spoke Welsh in 1911, compared to $44 \%$ in 2011. This decline must be partly related to the large percentage of the population in most Welsh counties who were born outside Wales.

The main focus of the project going forward will be the compilation of demographic statistics on the historic counties from across all Censuses from 1801 to 2011 . This will provide a dataset of great value to numerous studies of demography, socio-economic and political history. Another aim of the project will be to link historic county statistics derived from Census reports with those derived from the pre-Census era, the aim being to produce the best available demographic data across as long a span of our history as possible.

## 1. INTRODUCTION

### 1.1 Purpose of the Report

This report presents the first results from an ongoing project by the Historic Counties Trust to produce and analyse detailed statistics relating to the historic counties of the United Kingdom.

For centuries the historic counties have formed the standard geographical framework of the United Kingdom. In consequence national statistics have often been collated and almost always presented in terms of the historic counties and can be most easily understood by the public when presented in those terms.

Each UK Census from 1801 to 1911 presented population and other statistical measures in terms of the historic counties ${ }^{[1,2]}$. From 1921 onwards Census statistics have been presented solely in terms of contemporary local government areas. However, since these were closely based on the historic counties until 1961, it was possible to maintain a good degree of historical continuity, certainly in the broad population statistics.

The link between local government and the historic counties broke down in the 1960s. Censuses since then have continued to be based on contemporary local government areas. While this makes sense from the perspective of planning and delivering local government services, the everchanging nature of local government units has undermined the utility of the Census as a resource to study demographic and social change across decades and centuries.

The need for statistics based on the historic counties is important then for two reasons:

- To facilitate studies of population, birth rate, death rates, marriage rates, household composition, employment types etc. across the full sweep of our history and into the present day.
- To present important contemporary national statistics on a set of units which are familiar to the public and which conform to commonly held notions of community and identity.
Fortunately, the production of digitised borders for the historic counties by the Trust's Historic County Borders Project ${ }^{[3]}$ and the publication of electronic data from recent Censuses ${ }^{[4]}$, has meant that, with modern GIS techniques, it is relatively straightforward to produce detailed statistics for the historic counties from modern Census data.

This report describes the methods used by the project and presents some key results from the 2011 UK Census concerning population, population density, gender, marital status, age structure, ethnic group, general health, country of birth and Welsh language skills. A comparison with historical data is presented in relation to population, population density and Welsh language skills.
Future aspects of this project will include producing contemporary statistics for further Census variables (e.g. of employment, religious affiliation, long term illness or disability etc.). The main focus going forward, however, will be the compilation and analysis of demographic statistics on the historic counties from across all Censuses from 1801 to 2011, tying this together with demographic data from other sources and from the pre-Census era ${ }^{[5,6]}$. The results of the project will be published as reports and as downloadable GIS datasets.

### 1.2 The Historic Counties Trust

The Historic Counties Trust is a registered charity whose objects are:
a) To enhance the education of the public in the history, geography, natural history, architecture, traditions and boundaries of the Counties and Ridings of the United Kingdom;
b) To ensure high standards of surveying and recording on definitive maps and other public records of the boundaries of Counties, Ridings and other areas of local and historical interest and of the United Kingdom's geography generally;
c) To preserve such maps and records referred to in (b) above and make them available for public benefit.

The Historic Counties Trust is a company Registered in England and Wales with Company Number 5439118. Registered Office: 4 Rugby Way, Croxley Green, Hertfordshire, WD3 3PH. Registered Charity Number: 1114371.

### 1.3 The Historic Counties

For centuries the 92 historic counties of the United Kingdom have formed the familiar geographical background to our national life. Yet they are much more than a convenient geographical reference frame. They are fundamental to our notion of what our country is and of our own place within it. People's affinity for their county goes deep. Their idea of home is bound up with their native shire and all it stands for. The historic county provides a living link to past generations who trod the same ground and nurtured the same loyalties as today's Britons. Moreover, the historic counties speak to us of the wonderful diversity of the UK, each possessing its own distinctive history, landscapes, traditions, dialects and building styles. A huge literature, going back centuries, focuses on each historic shire. Their long unbroken histories have made them the natural basis for cultural, social and sporting organisations.

The historic counties have existed largely unchanged since the Middle Ages. Their original administrative functions became the responsibility of separate administrative counties and county councils set up by the Local Government Act 1888, the Local Government (Scotland) Act 1889 and the Local Government (Ireland) Act 1898. It was these administrative counties and county councils that were abolished by the Local Government Act 1972 and the Local Government (Scotland) Act 1973, not the historic counties ${ }^{[1,7,8]}$.

### 1.4 The Historic Counties Standard

The Historic Counties Standard ${ }^{[1]}$ provides a comprehensive definition of the names, areas and borders of the historic counties of the UK. It enables a consistent use of the historic counties to be made in those contexts for which they are the most natural geographical framework, especially in the fields of history, geography, heritage and education. It is used by The Office for National Statistics (ONS) as its definition of historic county in its Index of Place Names in Great Britain ${ }^{[7]}$, and by the Association of British Counties in its Gazetteer of British Place Names ${ }^{[8]}$.

### 1.5 Structure of the Report

Section 2 discusses the methodology used to produce the statistical maps and tables. Section 3 presents the results from the 2011 UK Census in relation to population, population density and gender. This includes a comparison of population between the 1901 census and the 2011 census. Section 4 presents the results from the 2011 Census in relation to Marital Status. Section 5 presents the results in relation to Age Structure. Section 6 presents the results in relation to Ethnic Group. Section 7 presents the results in relation to General Health. Section 8 presents results concerning the Country of Birth of the population in each county. Section 9 considers the distribution of Welsh speakers throughout the 13 counties of Wales. Finally, Section 10 presents some concluding remarks and a brief outline of the future work of the project.

## 2. METHODOLOGY

### 2.1 Historic County Border Data

The digital borders utilised in this work were from the full $(1: 5,000)$ resolution data available from the Historic County Borders Project ${ }^{[3]}$. The results presented are based on Definition A of the Historic Counties Standard, which considers each detached part to form part of the county in which it is locally situate. This is consistent with the approach taken by the Office for National Statistics in its Index of Place Names in Great Britain ${ }^{[7]}$.

### 2.2 Census Data

The statistics for Great Britain were calculated on the basis of Census Output Areas (OAs) - the smallest unit for which 2011 Census data is published for Great Britain ${ }^{[9]}$. For Northern Ireland, the statistics were calculated on the basis of Small Areas (SAs) - the smallest unit on which 2011 Census data is available for Northern Ireland ${ }^{[9]}$.

High resolution digital vector boundary data for the OAs and SAs was obtained from the Office for National Statistics' Open Geography Portal ${ }^{10]}$. An algorithm was written which ascribed an historic county to each OA or SA, based on the location of the centroid of each OA/SA. A visual check was then made by overlaying a map of the OA/SAs for each historic county on top of the historic county border data. This was done using QGIS ${ }^{[11]}$. Corrections were made in a small number of cases where the algorithm had ascribed the OA/SA to the wrong historic county. Around 200 OAs/SAs significantly overlap with county borders. For these, the OA/SA was assigned to the historic county in which the majority of its population appeared to lie. This fit was done by eye by overlaying the OA/SA and historic county data on general mapping data. The results were a CSV and a Shapefile with the historic county forming an attribute for each OA/SA.

The 2011 Census statistical data was obtained from Nomis ${ }^{[12]}$, a web-based database of labour market statistics run by the University of Durham on behalf of the ONS. Each statistical dataset required was downloaded for the full set of OAs/SAs. The data was downloaded in Microsoft Excel format. The historic county code was added to the dataset in Excel (Figure 2.1).

| Output Area | County Code | All usual residents | Age 0 to 4 | Age 5 to 7 | Age 8 to 9 | Age 10 to 14 | Age 15 | Age 16 to 17 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E00000001 | MSX | 194 | 11 | 3 | 0 | 5 | 2 | 3 |
| E00000003 | MSX | 250 | 14 | 7 | 5 | 5 | 1 | 2 |

| E00000007 | MSX | 123 | 5 | 0 | 0 | 4 | 1 | 0 |
| E00000010 | MSX | 102 | 4 | 1 | 0 | 0 | 0 | 0 |
| E00000012 | MSX | 213 | 9 | 2 | 0 | 5 | 0 | 1 |
| E00000013 | MSX | 216 | 4 | 0 | 0 | 0 | 0 | 23 |
| E00000014 | MSX | 154 | 4 | 0 | 0 | 0 | 0 | 0 |

Figure 2.1. Example of Age Structure data downloaded from Nomis with historic county code added in Excel

### 2.3 Calculating County Statistics

The totals for each statistical dataset were calculated for each historic county utilising Microsoft Access. Figure 2.2 shows the Marital Status dataset as read into Microsoft Access from the Excel file.

| \% marital_status_1 $\times$ |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Output Are : | County Codi - | Allover16 - | Single - | Married * | Civil_partnersh - | Separated - | Divorced * | Widowed - |
| E00000001 | MSX | 173 | 48 | 94 | 6 | 5 | 13 | 7 |
| E00000003 | MSX | 218 | 64 | 122 | 8 | 1 | 8 | 15 |
| E00000005 | MSX | 337 | 139 | 141 | 5 | 10 | 27 | 15 |
| E00000007 | MSX | 113 | 70 | 36 | 0 | 1 | 6 | 0 |
| E00000010 | MSX | 97 | 68 | 12 | 0 | 3 | 12 | 2 |
| E00000012 | MSX | 197 | 77 | 65 | 4 | 10 | 16 | 25 |
| E00000013 | MSX | 212 | 144 | 38 | 4 | 6 | 16 | 4 |
| E00000014 | MSX | 150 | 110 | 15 | 0 | 4 | 18 | 3 |
| E00000016 | MSX | 260 | 99 | 110 | 8 | 6 | 29 | 8 |
| E00000017 | MSX | 242 | 89 | 116 | 4 | 7 | 17 | 9 |

Figure 2.2. Example of Marital Status dataset in Microsoft Access
A SQL query was formed which summed the data using a 'group by' function over historic county code to produce the statistics for each historic county (Figure 2.3).

### 2.4 Producing the Historic County Statistical Maps

The final Excel files containing the derived county statistics were read into QGIS and used, along with the historic county border data, to produce the statistical maps presented here.

## 3. POPULATION, POPULATION DENSITY AND GENDER

### 3.1 Population and Gender from the 2011 Census

The data used here is taken from the Census table KS101UK - Usual resident population. This table provides information that numerates the usual resident population, broken-down by gender, as at census day, 27 March 2011.

The population data for the historic counties of England and Wales from the 1901 Census was obtained from the General Report of the 1901 Census ${ }^{[13]}$ 'Table 6: Proportional Area and Proportional Population at each Census, 1801 to 1901, in Ancient Counties, to the Total of England and Wales'.

### 3.2 Derived Statistics

Table 3.1 presents the total resident population derived from the 2011 Census for each of the historic counties of the UK. The area (in square miles) of each county is included. This was derived from the digitised border data down to Mean High Water (MHW). Population density (persons per square mile) was calculated from these two properties. Also included are the total number and percentage of males and females in each county.

Table 3.2. presents a comparison of Population and Population Density in the historic counties of England and Wales between the 1901 and 2011 Censuses.

Figure 3.1 is a map of population density in the historic counties of the UK from the 2011 Census.
Figure 3.2. is a map of the percentage of females in the historic counties of the UK from the 2011 Census.

Figure 3.3 is a map of population density in the historic counties of England and Wales from the 1901 Census.

Table 3.2. A comparison of Population and Population Density in the historic counties of England and Wales between the 1901 and 2011 Censuses

Figure 3.1. Population Density in the historic counties from 2011 Census

Figure 3.2. Percentage of females in the historic counties from the 2011 Census

Figure 3.3. Population Density in the historic counties of England and Wales from the 1901 Census

### 3.3 Discussion - Population 2011

The historic counties are, of course, diverse both in size and in the patterns of human settlement within them. This is amply illustrated by Table 3.1 and Figure 3.1. There are:

- 31 counties with a population of $<100,000$;
- 22 counties with a population between 100,000 and 500,000;
- 17 counties with a population between 500,000 and 1,000,000;
- 22 counties with a population over 1,000,000.

Nine of the ten counties with the smallest populations are in Scotland:

- Cromartyshire 7,074
- Kinross-shire 11,223
- Buteshire 12,534
- Sutherland 12,803
- Nairnshire 13,894
- Selkirkshire 16,010
- Peeblesshire 19,074
- Orkney 21,349
- Shetland 23,167
- Radnorshire 25,821

The ten counties with the largest populations are all in England:

- Yorkshire 5,218,838
- Lancashire 4,942,364
- Middlesex 4,000,927
- Essex 2,999,248
- Surrey 2,975,836
- Kent 2,747,715
- Staffordshire 2,159,392
- Hampshire 2,099,640
- Cheshire 1,668,894
- Warwickshire 1,632,885

Yorkshire has a population a factor of 738 bigger than that of Cromartyshire.

### 3.4 Discussion - Population Density 2011

It is not just in total population that there is huge range of values between the counties. Population density actually has a bigger range from 6.3/sq mile (Sutherland) up to 14,038/sq mile (Middlesex) - a difference by a factor of 2,228. There are:

- 24 counties with a population density of less than $100 /$ sq mile;
- 27 counties with a population density between $100 /$ sq mile and $500 /$ sq mile;
- 15 counties with a population density between $500 /$ sq mile and $1,000 /$ sq mile;
- 22 counties with a population density between 1,000 /sq mile and $2,000 /$ sq mile;
- 4 counties with a population density more than $2,000 /$ sq mile.

The ten counties with the smallest population densities are all in Scotland:

- Sutherland 6/sq mile
- Cromartyshire $19 /$ sq mile
- Argyllshire $21 /$ sq mile
- Ross-shire 23/sq mile
- Inverness-shire $28 /$ sq mile
- Peeblesshire $35 /$ sq mile
- Kirkcudbrightshire $53 /$ sq mile
- Shetland

42/sq mile

- Caithness $43 /$ sq mile
- Wigtownshire $55 /$ sq mile

The ten counties with the highest population density are:

- Middlesex 14,038/sq mile
- Surrey $3,921 /$ sq mile
- Lancashire 2,589/sq mile
- Renfrewshire $2,074 /$ sq mile
- Essex $1,885 /$ sq mile
- Staffordshire $1,836 /$ sq mile
- Hertfordshire $1,828 /$ sq mile
- Warwickshire $1,779 /$ sq mile
- Midlothian $1,717 /$ sq mile
- Kent $\quad 1,706 /$ sq mile

The extent of urban/suburban development within a county, compared to the extent of rural areas, is the biggest determinant of population density. The topography of each county is, of course, a major factor in shaping its population density ${ }^{[14]}$. The rugged terrain of Sutherland and the lakes and mountains of Westmorland preclude a high population density in either county. The highest population densities are found in counties with large areas of low lying, relatively flat land on which large-scale urban / suburban development has been possible.

Middlesex is unique in the extent to which it is covered by urban / suburban development. Whilst there are significant areas of green belt land in the south-west, north-west and north-east of Middlesex, the county is $80 \%$ urban / suburban, leading to its huge population density of $14,038 /$ sq mile. Surrey has the second highest population density at $3,921 / \mathrm{sq}$ mile, only $28 \%$ that of Middlesex. This reflects the fact that, though containing large urban / suburban developments, Surrey still contains large rural areas.

The distribution of population density across the UK is shown by Figure 3.1. The generally higher population density in English counties compared to those of Wales, Scotland and Northern Ireland is obvious from this. The highest densities are seen in the home counties (especially Middlesex $14,038 /$ sq mile, Surrey $3,920 /$ sq mile, Kent $1,706 /$ sq mile, Essex $1,885 /$ sq mile and Hertfordshire $1,828 /$ sq mile); in the west and north midlands (Warwickshire $1,779 / \mathrm{sq}$ mile, Worcestershire $1,587 /$ sq mile, Staffordshire 1,836/sq mile, Cheshire 1,613/sq mile); and in Lancashire (2,589/sq mile).

The county with the lowest population density in England is Westmorland (111/sq mile). However, there are 26 counties in the rest of the UK with a lower population density than this. Other English counties with notably low population densities are Cumberland (201/sq mile), Herefordshire (219/sq mile), Rutland (248/sq mile), Shropshire (352/sq mile), Lincolnshire (387/sq mile), Cornwall (391/sq mile), Norfolk (393/sq mile), Northumberland (395/sq mile), Devon ( $433 /$ sq mile) and Wiltshire (497/sq mile).

Of the 13 counties of Wales, only Glamorgan ( $1,598 /$ sq mile), Monmouthshire ( $950 /$ sq mile) and Flintshire ( $828 / \mathrm{sq}$ mile) have population densities comparable to the middle of the range in the counties of England. The three counties of mid-Wales have population densities lower than those
of any English county: Radnorshire ( $55 / \mathrm{sq}$ mile), Montgomeryshire ( $78 / \mathrm{sq}$ mile) and Brecknockshire (91/sq mile), as does Cardiganshire (109/sq mile). The remaining counties of west and north Wales all have population densities of less than 260/sq mile.

The 6 counties of Northern Ireland are more similar to each other in population density than are the counties of the other countries of the UK. Down (557/sq mile) and Antrim (524/sq mile) have population densities in the middle of the range of all UK counties. Population density falls from east to west, through Armagh (349/sq mile) and Londonderry (304/sq mile) to Tyrone (142/sq mile) and Fermanagh ( $86 / \mathrm{sq}$ mile). However, there are 23 counties in the rest of the UK with a lower population density than Fermanagh.

The counties of Scotland show a huge range in population density, from the lowest of 6/sq mile (Sutherland) to the highest of $2,074 /$ sq mile (Renfrewshire), a factor of 346 difference. Two of the top ten UK counties by population density are in Scotland: Midlothian (1,717/sq mile) and Renfrewshire ( $2,073 /$ sq mile).

As Figure 3.1 makes clear, the counties of the central belt of Scotland have much higher population densities than the rest of Scotland. Renfrewshire (2,074/sq mile), Midlothian (1,717/sq mile), West Lothian ( $1,290 /$ sq mile), Lanarkshire ( $1,147 /$ sq mile), Dunbartonshire ( $1,089 /$ sq mile) and Clackmannanshire ( $1,062 / \mathrm{sq}$ mile) are all within the top 20 counties of the UK in terms of population density. Fife ( $725 / \mathrm{sq}$ mile) and Stirlingshire ( $546 / \mathrm{sq}$ mile) also have significant population densities. To the south and to the north of the central belt the counties have much lower population densities. As noted above, nine of the ten UK counties with the lowest population densities are in Scotland.

### 3.5 Discussion - Gender

As can be seen from Table 3.1 and Figure 3.2, the ratio of males to females varies significantly across the historic counties. In three counties males outnumber females: Shetland (M50.8\% : F49.2\%), Rutland (M50.6\% : F49.4\%) and Fermanagh (M50.1\% : F49.9\%). In all other counties, females outnumber males - from Tyrone (M49.9\% : F50.1\%) up to Buteshire (M47.8\% : F52.2\%).

Many factors impact on the gender ratio in a population. In the UK more boys are born than girls, whereas mortality rates for men are higher at ages above $70{ }^{[15]}$. However, the gender ratios across the counties cannot be solely ascribed to differences in the age structure of each county. Buteshire does indeed have the largest percentage of people in the 'Over 64yo' category and, since women have longer life expectancy than men, one might expect there to be more females than males in the county. However, Ayrshire and Renfrewshire jointly have the second highest ratio of females to males (M47.9\% : F52.1\%). Neither has a particularly large population in the 'Over 64yo' category.

Another important factor which can affect gender ratio is international migration. This might be expected to consist of younger people and consequently boost the male population relative to the female. This may partly explain the relatively low percentages of females in some of the home counties: Cambridgeshire (50.2\%), Bedfordshire (50.3\%), Huntingdonshire (50.3\%), Middlesex (50.4\%) and Berkshire (50.4\%).

As is discussed in Section 7.3 there is significant variation across the counties in relation to General Health, some of which cannot be easily ascribed to differences in age structures. Where bad health can be related to certain heavy industries (e.g. coal mining) then one might expect that to affect males more than females, which could impact on the gender ratio in those counties.

### 3.6 Discussion - Comparison to 1901 Population / Population Density

One of the advantages of calculating statistics on the basis of the historic counties is that this enables comparison to statistics from historic data since the areas of the counties have not changed, apart from minor changes in coastline. Establishing reliable county population totals at different epochs is important for studies of the demographic, socio-economic and political history of our country ${ }^{[5,6]}$. In this present paper we restrict ourselves to a comparison of the population and population density of the historic counties of England and Wales between the 1901 Census and the 2011 Census. The 1901 Census was chosen since there is some doubt about the accuracy of the 1911 data due to Emmeline Pankhurst's campaign for women to boycott the 1911 census ${ }^{[16]}$.

Although pre-1921 Census reports do contain population data for the historic counties (described variously in post-1888 Census reports as 'Ancient or Geographical Counties', 'Ancient Counties' or 'Parliamentary Counties') slight adjustments to the published figures are needed to align them fully to Definition A of the Historic Counties Standard. This is because Definition A ascribes all detached parts to the county in which they are locally situate. Census reports from 1891-1911 only ascribe a detached part to the county in which it locally lies if it was one of these deemed to lie within that county by the Counties (Detached Parts Act) 1844 or as a result of the Divided Parishes and Poor Law Amendment Act 1876. This means that there are several detached parts which Definition A ascribes to the county in which they locally lie but which will have been enumerated with their parent county in the post-1888 Census reports. An aim of this project is to fully account for these and derive statistics across all Censuses (1801-2011) which are fully consistent with Definition A of the Historic Counties Standard. This adjustment has not been done for the purpose of the comparison presented here. However, the areas and populations involved are so small as to not invalidate the conclusions presented here.

Table 3.2 shows a comparison of Population and Population Density between 1901 and 2011 for the historic counties of England and Wales. The final column of this table calculates a 'Growth Ratio', defined as the ratio between the 2011 population compared to the 1901 population. Figure 3.3 shows the population density for the historic counties of England and Wales from the 1901 Census. This is presented with the same colour scheme as Figure 3.1 to allow easy comparison.

The 10 counties with the smallest Growth Ratios are:

- Merionethshire 0.77 (x 1901 population)
- Caernarfonshire 1.10
- Radnorshire 1.11
- Lancashire 1.12
- Middlesex 1.12
- Montgomeryshire 1.13
- Brecknockshire 1.13
- Cumberland 1.15
- Durham 1.24
- Cardiganshire 1.26

The 10 counties with the largest Growth Ratios are:

- Buckinghamshire 4.68 (x 1901 population)
- Hertfordshire 4.63
- Huntingdonshire 3.67
- Bedfordshire 3.52
- Berkshire 3.29
- Oxfordshire 2.83
- Essex 2.76
- Dorset 2.68
- Sussex 2.66
- Flintshire 2.64

Seven of the counties with the lowest 10 Growth Ratios are predominantly rural, 6 of them in Wales. Only in Merionethshire has population actually fallen since 1901 but there have been only very modest increases in Caernarfonshire, Radnorshire, Montgomeryshire, Brecknockshire and Cardiganshire. As discussed in Section 8, these 6 counties have seen relatively recent largescale immigration, especially from the rest of the Common Travel Area (CTA) but, nonetheless total populations have increased only modestly since 1901. The implications this has for the Welsh language are discussed in Section 9. Cumberland has a similar rural nature and also has a relatively large population born elsewhere in the CTA.

The other three counties with the lowest 10 Growth Ratios (Middlesex, Lancashire and Durham) are very different in character. These counties had huge populations and very high population densities in 1901. The decline of traditional industries in Lancashire and Durham and the already high populations and population densities are arguably major factors in the relatively low population growth. The small increase in the population of Middlesex (Growth Ratio 1.12) and the more modest increases in Surrey (1.48) and Kent (2.04) suggest that the greenbelt around the metropolis is significantly restricting population growth in this area.

The relatively static population of the metropolis contrasts with the growth of population seen in many other counties in south-east England. In 5 counties (Buckinghamshire, Hertfordshire, Huntingdonshire, Bedfordshire and Berkshire) the population has more than tripled in 110 years. Oxfordshire, Essex and Sussex have also seen large increases.

This high rate of growth in the south-east of England contrasts with that in northern counties. Cheshire's population increased between 1901 and 2011 by a Growth Ratio of 2.05 and Yorkshire's by 1.46. In other northern counties Growth Ratios are more modest: Westmorland (1.36), Northumberland (1.32), Durham (1.24), Cumberland (1.15) and Lancashire (1.12).

The largest area of population growth in Wales is in the north-east counties of Flintshire (Growth Ration 2.64) and Denbighshire (1.75). This is undoubtedly due to the large-scale industrial development alongside the River Dee from the end of the $19^{\text {th }}$ century. There has also been significant population growth in south Wales: Monmouthshire (Growth Ratio 1.76) and Glamorgan (1.54). As noted above, in other counties population growth has been modest.

A comparison of Figure 3.3 to Figure 3.1 underlines how remarkably small the relative changes in population density between the counties have been over the 110 years between the two censuses. The relative increase in population density in the south-east of England is clearly seen. In 1901 Middlesex and Surrey had much higher population densities than other southern counties. In the 2011 map the surrounding counties of Kent, Essex, Sussex, Hampshire, Berkshire, Buckinghamshire and Hertfordshire form a much larger area with higher population density than the rest of southern England. The relative increase in population density in the band of counties from Warwickshire, through Worcestershire, Staffordshire and Cheshire is also striking. The relative population densities of the northern counties of England are not massively different between the two epochs.

Comparing Figure 3.1 to Figure 3.3 for the counties of Wales shows no major changes beyond the relative increases in Glamorgan and Monmouthshire and, most markedly, in Flintshire and Denbighshire in the north-east.

## 4. MARITAL STATUS

### 4.1 Marital Status from the 2011 Census

The data used here was taken from the 2011 Census table KS103UK - Marital and civil partnership status. This table provides information that classifies usual residents aged 16 and over by marital and civil partnership status, for the United Kingdom as at census day, 27 March 2011. The following Marital Status categories are included:

- Single (never married or never registered a same-sex civil partnership);
- Married;
- In a registered same-sex civil partnership;
- Separated (but still legally married or still legally in a same-sex civil partnership);
- Divorced or formerly in a same-sex civil partnership which is now legally dissolved;
- Widowed or surviving partner from a same-sex civil partnership.

### 4.2 Derived Statistics

Table 4.1 presents the statistics in each of the Marital Status categories in the historic counties of the UK.

Figure 4.1 presents a map showing the percentage of the population aged 16 and over who are married in each of the historic counties.

| County <br> Aberdeenshire | Code <br> ABN | Single |  | Married |  | Civil Partnership |  | Separated |  | Divorced |  | Widowed |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 113,942 | 36\% | 151,622 | 48\% | 346 | 0.1\% | 8,081 | 3\% | 23,711 | 7\% | 20,562 | 6\% |

Table 4.1 Marital Status in the historic counties from the 2011 Census

Figure 4.1. Marital Status: Percentage in 'Married' category in the historic counties from the 2011 Census

### 4.3 Discussion - Marital Status

There are marked variations in the Marital Status categories across the counties. A major factor in these statistics is likely be the age distribution in each county.

The percentage in the 'Widowed or surviving partner from a same-sex civil partnership' category varies between 5\% (Middlesex and Surrey) up to 12\% (Buteshire). It cannot be a coincidence that Middlesex has the lowest percentage population in the 'Over 64yo' category of any county (11\%) and Surrey the second lowest (13\%). In contrast, Buteshire has the highest percentage of population in the 'Over 64yo' category (29\%). Other counties with percentages in the 'Widowed' category of more than $9 \%$ are Merionethshire, Wigtownshire, Kirkcudbrightshire and Sutherland. These counties all have a percentage of the population in the 'Over 64yo' category of more than 20\%.

The percentages in the 'Divorced or formerly in a same-sex civil partnership which is now legally dissolved' category are notably lowest in the 6 counties of Northern Ireland where the value is less than $7 \%$ in each county. Outside of Northern Ireland the next lowest percentages in this category are in Middlesex (7\%) with a relatively small spread of values up to Cornwall (11\%).

The percentages in the 'Separated' category vary between $2 \%$ (in many counties) up to $5 \%$ in Antrim. Londonderry (4\%) and Armagh (4\%) also have relatively high percentages in the 'Separated' category. This may be related to the low percentages in the 'Divorced' category in the counties of Northern Ireland.

The percentages in the 'Civil Partnership' category were low in all counties in 2011, following its introduction in 2004. The highest percentage is $0.4 \%$ in Middlesex. The lowest percentages (less than $0.2 \%$ ) are in Tyrone, Fermanagh, Orkney, Kinross-shire, Armagh, Londonderry and Antrim.

There are wide variations in the percentages of the 'Married' and 'Single' categories across the counties. These tend to reflect each other, rather than the percentages in the 'Separated', 'Divorced' or 'Widowed' categories. For example, the counties with the highest 'Married' percentages are Berwickshire (55\%), Peeblesshire (56\%) and Kinross-shire (60\%). These also have the lowest 'Single' percentages: Kinross-shire (23\%), Berwickshire (25\%) and Peeblesshire (25\%). These are predominantly rural counties with older populations. The lowest 'Married' percentages are in Middlesex (39\%), Lanarkshire (39\%), Midlothian (40\%) and Surrey (43\%). These are also the four counties with the highest 'Single' percentages: Middlesex (45\%), Lanarkshire ( $41 \%$ ), Midlothian ( $42 \%$ ) and Surrey ( $41 \%$ ). These are predominantly urban counties with younger populations.

As can be seen from Figure 3.1 there is no obvious geographical trend across the UK to the percentages in the 'Married' category.

## 5. AGE STRUCTURE

### 5.1 Age Structure from the 2011 Census

The data used here was taken from the 2011 Census table KS102UK - Age Structure. This covers the whole of the UK. Age is derived from the date of birth question and is a person's age at their last birthday, at $27^{\text {th }}$ March 2011. The Census table presents the total number of residents in each OS/SA along with the number in 16 age ranges. It also presents the Mean Age and the Median Age.

### 5.2 Derived Statistics

We have used the data in table KS102UK to calculate the number of residents in each historic county in four different age ranges:

- Under 18yo;
- 18yo to 44yo;
- 45yo to 64yo;
- Over 64yo.

These age ranges were chosen to facilitate a broad view of the Age Structure differences between the historic counties.

Table 5.1 shows the number and percentages in the historic counties in each of these age ranges. It also shows the Mean Age for each historic county.

Figure 5.1 is a map showing the Mean Age in the historic counties.

| Name | Code | Under 18 |  | 18to44 |  | 45to64 |  | Over64 |  | Mean Age |

## Table 5.1. Age Structure in the historic counties from the 2011 Census

Figure 5.1. Mean Age in the historic counties from the 2011 Census

### 5.3 Discussion - Age Structure

It is clear from Table 5.1 and Figure 5.1 that there are very significant differences in the Age Structure across the counties.

The Mean Age (Figure 5.1) paints a broad-brush picture of the distribution of Age Structure across the counties. These vary from Middlesex (35.5yo) up to Buteshire (48.1yo), a huge difference of 12.6 years. In Great Britain there is a clear trend for the mean age to be lowest in the home counties, the southern midlands, Yorkshire, Lancashire, in South Wales (Glamorgan and Monmouthshire) and in the central belt of Scotland (Lanarkshire, West Lothian, Midlothian). Mean Age tends to be higher in north and west Wales, in southern Scotland and along the west and north of Scotland, and in south west England. The trend is that the counties with the highest population densities tend to have the lowest mean ages. All 6 counties of Northern Ireland have mean ages among the lowest in the UK.

The more detailed statistical breakdowns of the percentage in each of the four age ranges (Table 5.1) adds detail to the trends seen in the Mean Age data.

The percentage of people in the 'Under 18yo' category varies markedly across the counties, with a spread from highest to lowest of $9 \%$. Buteshire (16\%) and Cardiganshire (17\%) have the smallest fraction of Under 18yos. The 4 counties with the highest fraction of Under 18yos are all in Northern Ireland: Fermanagh (24\%), Londonderry (25\%), Armagh (26\%) and Tyrone (26\%).

The percentage of people in the '18yo to 44yo' category varies even more markedly, with a spread from highest to lowest of $24 \%$. The spread in percentage in this category is fairly even from the lowest end (Buteshire 23\%, Sutherland $24 \%$ ) up to the county with the fourth highest percentage in the '18yo to 44yo' category (Aberdeenshire 40\%). However, the three counties with the highest percentages (Midlothian 42\%, Surrey 43\%, Middlesex 47\%) can be considered outliers.

There is less variation in the spread of the percentage of the population in the '45yo to 64yo' category, with a spread from highest to lowest of $12 \%$. Middlesex (21\%) and Surrey (23\%) have the lowest fraction in this age range - the opposite of the situation for the '18yo to 44yo' category. The 10 counties with the highest fraction in this age range are all in Scotland and predominantly rural, with the highest of all being in Sutherland (33\%) and Kinross-shire (33\%).

The percentage of the population in the 'Over 64yo' category also varies markedly between counties, with the spread from highest to lowest being 18\%. Middlesex (11\%) and Surrey (13\%) have the smallest fraction in the 'Over 64yo' category. The counties of Northern Ireland have low fractions in the 'Over 64yo' category with Tyrone (13\%), Londonderry (13\%) and Armagh (13\%) having the third to fifth lowest percentages of all UK counties. The spread of percentages is fairly even up to Dorset ( $23 \%$ ). The four counties with a percentage in the 'Over 64yo' category higher than this could be considered outliers: Merionethshire (25\%), Sutherland (25\%), Radnorshire (26\%) and Buteshire (29\%).

## 6. ETHNIC GROUP

### 6.1 Ethnic Group from the 2011 UK Census

The data used here was taken from the 2011 Census table KS201UK - Ethnic Group. This covers the whole of the UK. Residents are asked to self-identify their Ethnic Group from the following categories:

- White;
- Gypsy / Traveller / Irish Traveller;
- Mixed / Multiple Ethnic Group;
- Asian / Asian British: Indian;
- Asian / Asian British: Pakistani;
- Asian / Asian British: Bangladeshi;
- Asian / Asian British: Chinese;
- Asian / Asian British: Other Asian;
- Black / African / Caribbean / Black British;
- Other Ethnic Group.

These classifications are the recommended framework from the 'Harmonised Concepts and Questions for Social Data Sources Primary Standards' for presentation of UK outputs on ethnic group ${ }^{[17]}$.

### 6.2 Derived Statistics

Table 6.1 shows the numbers in each Ethnic Group in the historic counties.
Table 6.2 shows the percentages in each Ethnic Group in the historic counties.
Figure 6.1 is a map showing the percentage in the 'White' Ethnic Group in the historic counties.
Figure 6.2 is a map showing the percentage in the ‘Black / African / Caribbean / Black British’ Ethnic Group in the historic counties.

Table 6.2. Ethnic Group percentages in the historic counties from the 2011 Census

Figure 6.1. Ethnic Group: Percentage in 'White' category in the historic counties from the 2011 Census

Figure 6.2. Ethnic Group: Percentage in ‘Black / African / Caribbean / Black British’ category in the historic counties from the 2011 Census

### 6.3 Discussion of Ethnic Group

The distribution within each Ethnic Group varies widely across the historic counties.
The counties with, by some distance, the largest percentages in the 'Asian / Asian British: Indian' Ethnic Group are Leicestershire (12.5\%) and Middlesex (8.6\%). Significant populations are also found in Staffordshire (5.2\%), Buckinghamshire (4.6\%), Warwickshire (4.5\%) and Essex (4.2\%). In 82 counties, the percentage in this Ethnic Group is less than 2\%.

The counties with the largest populations in the 'Asian / Asian British: Pakistani' Ethnic Group are Warwickshire (5.7\%), Bedfordshire (5.5\%), Buckinghamshire (5.5\%), Worcestershire (5.4\%) and Yorkshire (4.5\%). It is notable that the 'Asian / Asian British: Pakistani' Ethnic Group is much less concentrated in Middlesex than is the 'Asian / Asian British: Indian' Ethnic Group population. In 82 counties, the percentage in the 'Asian / Asian British: Pakistani' Ethnic Group is less than 2\%.

Only 4 counties have a population in the 'Asian / Asian British: Bangladeshi’ Ethnic Group of more than $1 \%$ : Middlesex (3.4\%), Bedfordshire (2.8\%), Essex (2.4\%) and Warwickshire (1.4\%).

Only 5 counties have populations in the 'Asian / Asian British: Chinese' Ethnic Group of more than $1 \%$, the highest of these is Middlesex with a percentage of $1.7 \%$.

In some counties, there are significant populations in the 'Asian / Asian British: Other Asian’ Ethnic Group, especially around the home counties: Middlesex (5.6\%), Surrey (3.4\%), Essex (2.4\%) and Buckinghamshire (2.3\%).

As is clearly seen from Figure 6.2, the home counties have the highest percentages in the 'Black / African / Caribbean / Black British' Ethnic Group: Middlesex (11.2\%), Surrey (10.8\%), Essex (7.1\%) and Kent (6.3\%). Other counties with sizeable populations in this Ethnic Group are Warwickshire (4.8\%), Bedfordshire (4.9\%) and Buckinghamshire (4.3\%). In 76 counties (including all those in Wales, Scotland and Northern Ireland) the percentage in the 'Black / African / Caribbean / Black British' Ethnic Group is less than 2\%.

The percentage in the 'White' Ethnic Group is closely related to the relative numbers in the other Ethnic Groups. The counties with large percentages in Ethnic Groups other than 'White' tend to be located around major population centres especially in the home counties, in the midlands of England, in Yorkshire, in Lancashire and the central belt of Scotland. Figure 6.1 shows these areas as also having the lower percentages in the 'White' Ethnic Group. Middlesex (57.8\%) is an outlier, reflecting the ethnically diverse nature of much of the metropolis. The counties with the next lowest percentages in the 'White' Ethnic Group are Surrey (73.2\%) and Essex (75.7\%), reflecting the ethnically diverse nature of the metropolitan parts of these counties. Across the UK there are 63 counties which have a percentage in the 'White' Ethnic Group of more than $95 \%$, including all 6 of those in Northern Ireland, all in Wales apart from Glamorgan (93.7\%) and all but 4 counties in Scotland (Renfrewshire, Lanarkshire, West Lothian and Aberdeenshire).

## 7. GENERAL HEALTH

### 7.1 General Health from the 2011 Census

The data used here was taken from the 2011 Census table KS301UK - Health and provision of unpaid care. This table covers the whole of the UK. General health is a self-assessment of a person's general state of health. People were asked to assess whether their health was 'Very Good', 'Good', 'Fair', 'Bad' or 'Very Bad'.

### 7.2 Derived Statistics

Table 7.1 presents the General Health figures (numbers and percentages) in three categories:

- Very Good / Good - formed from amalgamating these two categories from KS301UK;
- Fair - as from KS301UK;
- Bad / Very Bad - formed from amalgamating these two categories from KS301UK.

The amalgamated categories were created to enable a more straightforward consideration of differences in General Health among the historic counties.

Figure 7.1 shows the percentage of those stating their General Health to be 'Very Good' or 'Good' from the 2011 Census for each of the historic counties of the UK.

| Name | Code | Very Good/Good |  | Fair |  | Bad / Very Bad |  |

Table 7.1. General Health in the historic counties from 2011 Census

Figure 7.1. General Health: Percentage in 'Very Good / Good' category in the historic counties from the 2011 Census

### 7.3 Discussion - General Health

There are significant variations across the historic counties in the percentages in the 'Very Good / Good’ General Health category - from 75\% (Carmarthenshire) to 87\% (Peeblesshire, Kinrossshire, Kincardineshire). There are also significant variations across the counties in the percentages in the 'Bad / Very Bad' General Health category - from 3\% (Kinross-shire, Peeblesshire, Kincardineshire, Berkshire, Orkney, Shetland, Rutland) to 8\% (Lanarkshire, Brecknockshire, Monmouthshire, Glamorgan, Carmarthenshire, Durham).

The variation in the 'Very Good / Good' General Health category across the counties cannot be explained solely by age distribution. Buteshire is the county with the highest percentage of population in the 'Over 64yo' category but there are 12 counties with a higher percentage in the 'Bad / Very Bad' General Health category. Middlesex has the lowest percentage in the 'Over 64yo' category but 15 counties have a higher percentage in the 'Very Good / Good' General Health category.

The geographical distribution of the 'Very Good / Good' category across the counties (Figure 7.1) shows that the counties in Scotland tend to have higher percentages for this category. Aside from Wigtownshire (78\%), Ayrshire (80\%) and Lanarkshire (79\%), this category has percentages of more than $80 \%$ for the rest of Scotland. In particular, a large area including Perthshire, Invernessshire, Aberdeenshire, Banffshire, Morayshire, Nairnshire, Kincardineshire and Kinross-shire has 'Very Good / Good' General Health of more than 83\% in each county. Shetland and Orkney also have values more than $85 \%$.

In England, southern counties tend to have higher values for the 'Very Good / Good' category. All the counties in a large area including Huntingdonshire, Cambridgeshire, Hertfordshire, Middlesex, Surrey, Berkshire, Buckinghamshire, Oxfordshire and Wiltshire have values more than 83\%. Most other southern counties have 'Very Good / Good' General Health percentages of more than 80\%, the exceptions being Cornwall, Devon and Norfolk which have percentages between 77\%-80\%. The counties of the march (Shropshire, Cheshire, Herefordshire) all have percentages of $81 \%$. Further north only Westmorland has a 'Very Good / Good' percentage of more than 77\%. Worcestershire, Staffordshire, Derbyshire, Nottinghamshire, Lincolnshire, Yorkshire, Lancashire, Northumberland, Cumberland all have percentages between 77\%-80\%. Durham has the lowest 'Very Good / Good' General Health percentage in England (76\%).

The six counties of Northern Ireland have 'Very Good / Good' General Health percentages in the median range for the UK for this category: Tyrone (78\%), Antrim (79\%), Armagh (79\%), Down (81\%), Fermanagh (81\%) and Londonderry (79\%).

Wales generally has lower percentages in the 'Very Good / Good' category than England. Only Caernarfonshire has a percentage more than $80 \%$. Across north and west Wales are a group of counties (Anglesey, Flintshire, Denbighshire, Montgomeryshire, Cardiganshire, Pembrokeshire) with percentages for this category between $77 \%-80 \%$. In south and mid Wales are a group of counties with the lowest 'Very Good / Good' percentages in the UK (aside from Durham): Glamorgan (77\%), Radnorshire (77\%), Brecknockshire (77\%), Monmouthshire (77\%), Carmarthenshire (75\%).

The 'Bad/Very Bad Health' category reinforces the conclusions from the 'Very Good/Good Health' category. Six counties have a percentage more than 7\%: Carmarthenshire, Glamorgan, Monmouthshire, Brecknockshire, Durham and Lanarkshire. Seven counties have a percentage less than 4\%: Rutland, Shetland, Orkney, Berkshire, Kincardineshire, Peeblesshire, Kinrossshire.

The inequality that exists in General Health between populations is often explained in terms of area disadvantage. Measures of health status such as life expectancy and health expectancy are shown to be more favourable in some geographical locations than others and to be strongly patterned with material factors such as income, environment, housing quality, unemployment, access to services and education ${ }^{[18]}$. It is very striking from the statistics presented here that the counties with the worst health revealed by these indicators (i.e. Glamorgan, Monmouthshire, Brecknockshire, Carmarthenshire, Durham, Lanarkshire) are those which, until recent times, have had a huge coal mining industry. By the time of the 2011 census this mining industry had only declined over the previous 20 years. Whilst conventional theories about the correlation between disadvantage and health may explain some of this effect, it seems probably that the more direct effects of working in the mining industry continue to affect the physical and mental health of many in these counties.

## 8. COUNTRY OF BIRTH

### 8.1 Country of Birth from the 2011 Census

The data used here was taken from the 2011 Census Table QS203UK - Country of Birth. The country of birth question included six tick box responses - one for each of the four parts of the UK, one for the Republic of Ireland, and one for 'Elsewhere'. Where a person ticked 'Elsewhere', they were asked to write in the current name of the country in which they were born.

### 8.2 Derived Statistics

Table 8.1 shows the Country of Birth (as totals and percentages) for the 39 historic counties of England. The values from the Census table have been allocated into three categories:

- England;
- Rest of Common Travel Area (CTA) - i.e. Wales, Scotland, Northern Ireland, Republic of Ireland, Channel Islands, Isle of Man;
- Rest of the World.

These categories were decided upon to enable a study of the relative population within each county in England who were born outside England. Since residents from elsewhere in the CTA are not generally regarded as immigrants it was decided to study the relative populations in each county from other parts of the CTA compared to those from elsewhere in the world.

Table 8.2 shows the Country of Birth for the 13 historic counties of Wales. The categories are:

- Wales;
- Rest of Common Travel Area (CTA) - i.e. England, Scotland, Northern Ireland, Republic of Ireland, Channel Islands, Isle of Man;
- Rest of the World.

Table 8.3 shows the Country of Birth for the 6 historic counties of Northern Ireland. A decision was taken for Northern Ireland to separate the figures from the Republic of Ireland from those of the rest of the CTA. The categories are:

- Northern Ireland;
- Republic of Ireland;
- Rest of Common Travel Area (CTA) - i.e. England, Scotland, Wales, Channel Islands, Isle of Man;
- Rest of the World.

Table 8.4 shows the Country of Birth for the 34 historic counties of Scotland. The categories are:

- Scotland;
- Rest of Common Travel Area (CTA) - i.e. England, Wales, Northern Ireland, Republic of Ireland, Channel Islands, Isle of Man;
- Rest of the World.

Figure 8.1 shows, for each historic county, the percentage of its population who were born in the country of that county (i.e. for counties in England it shows the percentage born in England).

Figure 8.2 shows, for each historic county, the percentage of its population who were born elsewhere in the Common Travel Area (i.e. for counties in England it shows the percentage born in Scotland, Wales, Northern Ireland, Republic of Ireland, Channel Islands, Isle of Man).

Table 8.4. Country of Birth in the historic counties of Scotland from 2011 Census

Figure 8.1. Country of Birth: Percentage of the resident population of each historic county who were born in the country of that county

Figure 8.2. Country of Birth: Percentage of the resident population of each historic county who were born elsewhere within the Common Travel Area

### 8.3 Discussion - Country of Birth

As regards England, Table 8.1 and Figures 8.1 and 8.2 make clear the concentration of recent immigration into the southeast of England. Middlesex is a clear outlier in this relationship, with only $56.0 \%$ of its population being born in England and $39.8 \%$ being born outside the CTA. Some of the other home counties also show relatively low percentages of being born in England: Bedfordshire (79.1\%), Buckinghamshire (78.4\%), Essex (78.8\%) and Surrey (70.5\%). All other English counties have more than 80\% of their population born in England. Notably, Cumberland, Westmorland, Durham, Cheshire, Derbyshire, Lincolnshire, Norfolk, Dorset, Devon and Cornwall have more than $90 \%$ of their population born in England and less than 7\% from outside the CTA.

Figure 8.2 shows that the distribution of the population from elsewhere in the CTA does not vary that significantly across the English counties. Herefordshire (7.8\%) and Shropshire (6.6\%) are the only counties where this is more than $6 \%$. It may be significant that these counties border those of mid Wales.

Table 8.2 and Figures 8.1 and 8.2 show a very different situation in Wales compared to England. The percentage of the population born in Wales is generally much lower than the equivalent values for the English counties. In 5 of the 13 counties less than $60 \%$ of the resident population were born in Wales: Radnorshire (41.0\%), Montgomeryshire (44.2\%), Flintshire (50.9\%), Cardiganshire ( $55.3 \%$ ) and Merionethshire ( $59.9 \%$ ). Even in the counties with the highest percentages born in Wales (Glamorgan 79.4\%, Monmouthshire 80.0\%) these values are significantly lower than in almost all English counties.

This effect is largely accounted for by the high percentage of the population of the counties of Wales who were born in other parts of the CTA (i.e. outside of Wales). This is more than half of the population in Radnorshire (55.7\%) and Montgomeryshire (52.2\%) and more than a third of the population in Flintshire (45.4\%), Cardiganshire (39.2\%) and Merionethshire (37.7\%). The lowest value is in Glamorgan (14.5\%), still higher than in almost every English county. Glamorgan also has the largest percentage from outside the CTA (6.2\%).

Northern Ireland provides a contrast to Wales. In each of the six counties over $83 \%$ of the population were born in Northern Ireland, the lowest being Fermanagh (83.9\%), the highest Londonderry (90.0\%). The percentages from outside the CTA are similar to those of the Welsh counties, and at the lower end of those recorded in the English counties. The percentages from elsewhere in the CTA are much lower than recorded in the Welsh counties, being similar to those recorded in the English counties. The percentages born in the Republic of Ireland (ROI) are lower than those from the rest of the CTA, with one exception. In Fermanagh $6.7 \%$ of the population was born in the ROI. The location of Fermanagh, surrounded on 3 sides by the ROI, is probably a significant factor in this.

Many of the counties of Scotland show a similar effect to that seen in Wales, a large percentage of the population not born in Scotland but from elsewhere in the CTA. This figure is more than $10 \%$ for 26 of Scotland's 34 counties. In 5 counties this fraction of the population is more than 20\%: Berwickshire (28.9\%), Sutherland (23.9\%), Cromartyshire (23.0\%), Dumfriesshire (20.0\%) and Morayshire (21.8\%). Figure 8.2 shows that the central lowlands have the lowest percentage from elsewhere in the CTA - with all the counties of the south and north of the Scotland having percentages from the CTA of more than $10 \%$. In contrast to this, the percentage of the population from outside the CTA is generally much smaller, although this is more than $10 \%$ in 2 counties: Aberdeenshire (10.9\%) and Midlothian (12.5\%). The percentage in each county born in Scotland varies from 66.5\% (Berwickshire) up to 88.9\% (Dunbartonshire).

Sadly, the data collected in the 2011 Census do not enable the historic county in which each person born in the UK was born to be ascertained. This means that an analysis of those born in the county compared to other counties in the UK cannot be easily undertaken. Such an analysis would be fascinating for many reasons, especially in looking at the changing population in rural counties of England.

It was noted above that in many counties in Wales and Scotland a large fraction of the population was born in other parts of the CTA. In broad terms what seems to be happening in these counties is that a substantial part of the population born in the county has left and a large number of people born elsewhere in the CTA (predominantly from England) has moved into the county. Such an effect may well also be happening in more rural counties of England. In these counties, though, most of the population who have moved to the county will have been born elsewhere in England and the figures don't enable us to separate people born in one English county from people born in another English county. It may be telling that, looking at the figures for the people born in other parts of the CTA (i.e. outside England), the highest totals are from predominantly rural counties such as Herefordshire (7.8\%), Shropshire (6.6\%), Rutland (5.2\%), Gloucestershire (5.1\%), Wiltshire ( $4.9 \%$ ) and Cumberland ( $4.8 \%$ ). If we could enumerate the population of such counties who had been born in other English counties and add this to the totals from elsewhere in the CTA then we may find a picture not too dissimilar to what is being seen in rural counties in Wales and Scotland.

## 9. WELSH LANGUAGE

### 9.1 Welsh Language Skills from the 1911 and 2011 Censuses

The 2011 data used here was taken from the 2011 Census table KS207WA - Welsh language skills. This table provides information, for Wales only, that classifies usual residents aged three and over by their Welsh language skills, as at census day, 27 March 2011. Residents were asked to choose from the following options:

- No skills in Welsh;
- Can understand spoken Welsh only;
- Can speak Welsh;
- Can speak but cannot read or write Welsh;
- Can speak and read but cannot write Welsh;
- Can speak, read and write Welsh;
- Other combination of skills in Welsh.

The 1911 data used here was taken the General Report of the 1911 Census ${ }^{[19]}$.

### 9.2 Derived Statistics

Table 9.1 shows the number of Welsh speakers from the 2011 Census and the percentage of Welsh Speakers (of residents over 3 years or age) from both the 2011 census and the 1911 census.

For the 2011 Census these figures were derived by summing those who chose one of the options:

- Can speak Welsh;
- Can speak but cannot read or write Welsh;
- Can speak and read but cannot write Welsh;
- Can speak, read and write Welsh.

For the 1911 census these figures were derived from Table CXXXIII of the General Report of the 1911 Census. This table shows those speaking English only, Welsh only and those speaking both languages. No questions were asked on the 1911 Census about other Welsh language skills. Hence, the analysis presented here relates only to those who can speak Welsh. Table CXXXIII presents the total speaking Welsh for the combination of 'administrative county with associated county boroughs' rather than for the historic counties. Elsewhere, the Census report tabulates the differences in area between the administrative counties and the historic counties and the differences in overall population. In future work, this project will account for these differences. In the present work they have not been taken into account. The areas and populations involved are very small and will not affect the conclusions of the analysis presented here.

Figure 9.1 is a map showing the percentage of Welsh Speakers in the 13 historic counties of Wales from the 2011 Census.

Figure 9.2 is a map showing the percentage of Welsh Speakers at Census Output Area level within the 13 historic counties of Wales from the 2011 Census.

Figure 9.3 is a map showing the percentage of Welsh Speakers in the 13 historic counties of Wales from the 1911 Census.

| County Name | County Code | Speak Welsh 2011 | \% Speak Welsh 2011 | \% Speak Welsh 1911 |
| :---: | :---: | :---: | :---: | :---: |
| Anglesey | AGL | 38,568 | 57.2\% | 88.7\% |
| Brecknockshire | BRN | 10,272 | 15.7\% | 41.5\% |
| Cardiganshire | CRD | 34,926 | 47.4\% | 89.6\% |
| Carmarthenshire | CRM | 78,265 | 43.9\% | 84.9\% |
| Caernarfonshire | CRN | 71,524 | 53.2\% | 85.6\% |
| Denbighshire | DBH | 44,704 | 20.4\% | 56.7\% |
| Flintshire | FLT | 28,654 | 13.8\% | 42.2\% |
| Glamorgan | GLM | 148,931 | 11.7\% | 38.1\% |
| Monmouthshire | MNM | 46,683 | 9.4\% | 9.6\% |
| Merionethshire | MRN | 21,550 | 58.7\% | 90.3\% |
| Montgomeryshire | MTG | 12,697 | 21.2\% | 44.8\% |
| Pembrokeshire | PMB | 22,607 | 19.1\% | 32.4\% |
| Radnorshire | RDN | 2,635 | 10.5\% | 5.4\% |

Table 9.1. A comparison of Welsh speakers in the 13 historic counties of Wales between the 1911 and the 2011 Censuses

Figure 9.1. Welsh Language Skills: Percentage of Welsh Speakers in the 13 historic counties of Wales from the 2011 Census

Figure 9.2. Welsh Language Skills: Percentage of Welsh Speakers at Census Output Area level within the 13 historic counties of Wales from the 2011 Census

Figure 9.3. Welsh Language Skills: The percentage of Welsh Speakers in the 13 historic counties of Wales from the 1911 Census

### 9.3 Discussion - Welsh Language Skills

Table 9.3 and Figures 9.1, 9.2 and 9.3 present a stark view of the relative decline of the Welsh language over the last century.

Based on the 1911 Census data one could view the Welsh counties as falling into three groups as regards the percentage of Welsh speakers within them at that time.

- More than $80 \%$ Welsh speakers: Cardiganshire (90\%), Merionethshire (90\%), Carmarthenshire (85\%), Anglesey (89\%), Caernarfonshire (86\%);
- Between $30-60 \%$ Welsh speakers: Denbighshire (57\%), Montgomeryshire (45\%), Brecknockshire (42\%), Flintshire (42\%), Glamorgan (38\%), Pembrokeshire (32\%);
- Less than $10 \%$ Welsh speakers: Monmouthshire (10\%), Radnorshire (5\%).

The picture from the 2011 Census is one of a decline in percentage of Welsh Speakers in all but one county. The first group from 1911 still forms a distinct grouping but the percentage who speak Welsh in these counties is now between $40 \%$ to $60 \%$. The rest of the counties can, from the 2011 data, be better described as forming one group having percentage Welsh speakers less than 22\%.

- Between 40\%-60\% Welsh speakers: Merionethshire (59\%), Anglesey (57\%), Caernarfonshire (53\%) Cardiganshire (47\%), Carmarthenshire (44\%);
- Less than 22\% Welsh speakers: Montgomeryshire (21\%), Denbighshire (20\%), Pembrokeshire (19\%), Brecknockshire (16\%), Flintshire (14\%), Glamorgan (12\%), Radnorshire (11\%), Monmouthshire (9\%).

The decline in the percentage of Welsh speakers between 1911 and 2011 has been huge in many counties:

- Anglesey
- Brecknockshire
- Cardiganshire
- Carmarthenshire
- Caernarfonshire
- Denbighshire
- Flintshire
- Glamorgan
- Merionethshire
- Montgomeryshire
- Pembrokeshire
from $89 \%$ to $57 \%$;
from $42 \%$ to $16 \%$;
from $90 \%$ to $47 \%$;
from $85 \%$ to $44 \%$;
from $86 \%$ to $53 \%$;
from $57 \%$ to $20 \%$;
from $42 \%$ to $14 \%$;
from $38 \%$ to $12 \%$;
from $90 \%$ to $59 \%$;
from $45 \%$ to $21 \%$;
from $33 \%$ to $19 \%$.

Among the biggest falls are in the Welsh speaking heartlands of Anglesey, Caernarfonshire, Merionethshire, Cardiganshire and Carmarthenshire.

In contrast the percentage of Welsh speakers in Monmouthshire has seen little change (from a very low level in 1911). In only one county, Radnorshire, has the percentage of Welsh speakers increased, from 5\% in 1911 to $11 \%$ in 2011.

Figure 9.2 shows the percentage of Welsh speakers at Census Output Area level with the historic counties superimposed upon it. The relationship between the historic counties and the Welsh language is made clear by this map. In the Welsh heartland counties of Anglesey, Caernarfonshire, Merionethshire, Cardiganshire and Carmarthenshire the percentage of Welsh speakers falls in only a few places to less than $20 \%$. But in many places it is still more than $70 \%$, especially on the Lleyn peninsula in Caernarfonshire and in much of Merionethshire. The long-
standing division in Pembrokeshire between the Welsh speaking north of the county and the English speaking south (the Landsker line) is clearly seen.

The extension of the main Welsh speaking area from Carmarthenshire into the far north-west of Glamorgan and south-west of Brecknockshire can be seen, as can the very low levels of Welsh speakers in most of Glamorgan, Brecknockshire and all of Radnorshire and Monmouthshire. The division of Montgomeryshire into a Welsh speaking north and west and an English speaking south and east stands out clearly. Denbighshire is perhaps most fascinating with some of the highest level of Welsh speakers, above $60 \%$ in the west of the county, but also, in the far east of the county, some of the lowest percentages of Welsh speakers in the whole country. The small number of Welsh speakers in Flintshire is clearly seen, especially in the Maelor Saesneg detached part of the county.

When considering the actual numbers of Welsh speakers, rather than the percentages, the situation looks less bleak. The total number of Welsh speakers in Wales according to the 2011 census is 562,000 , compared to 977,366 at the 1911 census. Hence, by 2011 the number of Welsh speakers had fallen to $58 \%$ of the level it was 100 years previously. However, whereas $44 \%$ of the population could speak Welsh in 1911, only $19 \%$ could in 2011 . The combination of declining numbers of Welsh speakers and the general increase in the population creates this effect. It is also worth noting that the actual total of Welsh speakers in the 2011 census is higher than that from the 1971 Census.

The scope of this report does not extend to a detailed investigation of the state of the Welsh language over the past 100 years. There have been many detailed studies of this kind ${ }^{[20,21]}$. However, it is very clear from Section 8 (Table 8.2) of this report that in all Welsh counties a huge proportion of the population was born outside Wales, from $20 \%$ in Monmouthshire up to $59 \%$ in Radnorshire. In the counties of the Welsh speaking heartlands the percentages born outside Wales are: Anglesey (34\%), Caernarfonshire (36\%), Cardiganshire (45\%), Carmarthenshire ( $24 \%$ ) and Merionethshire ( $40 \%$ ). This must inevitably have had a major effect on the percentages of Welsh speakers throughout the country.

Studies of the state of the Welsh language would benefit greatly from the use of the historic counties of Wales as the geographical basis for comparisons between epochs. Recent studies have sought to describe the distribution of Welsh language skills with reference to the 22 unitary authorities of Wales ${ }^{[21]}$. These were created in 1996 to provide local government services. They cover hugely different areas and have very different population sizes. No Welsh skills statistics are available for them from before 1996. It is hard to see how they can be used as any kind of geographical basis for studying the Welsh language. The benefits of basing an analysis on the historic counties are obvious and overwhelming.

The obvious way to subdivide the historic counties for the purpose of studying Welsh language skills over time would be to use the communities / civil parishes. Most of the current local government communities have the same borders as civil parishes which go back to least the middle of the $19^{\text {th }}$ century. Figure 8.2 shows the value of presenting statistics over smaller areas within the context of the historic counties. Unfortunately, Census Output Areas are arbitrary units which change over time. An analysis based on the historic counties and the communities / civil parishes would overcome this problem.

## 11 CONCLUDING REMARKS

This report has presented the first results from a project to produce and analyse detailed statistics relating to the historic counties of the UK. Basing statistics on the historic counties enables:

- Studies of population and other demographic indicators across decades and centuries on a fixed, meaningful geographic framework;
- The presentation of important contemporary national statistics on a set of areas which are commonly understood by the public and which are important cultural entities.
The focus in this report has been on producing contemporary statistics, based on the counties, for the main demographic indicators. A comparison with historical data was presented only in relation to population, population density and Welsh language skills.
The main focus of the project going forward will be the compilation of demographic statistics on the historic counties from across all Censuses from 1801 to 2011. This will provide a dataset of great value to numerous studies of demography, socio-economic and political history.
A key part of this work will be to adjust the statistics within the Census reports across all epochs onto Definition A of the Historic Counties Standard. Such adjustments will be relatively straightforward for Censuses up to 1911 since figures are provided in these Census reports for the historic counties. Adjustments will have to be made for the slightly different way in which the Census reports from 1851 onwards deal with the effects of the Detached Parts Act 1854 and the Divided Parishes and Poor Law Amendment Act 1876. Making such adjustments should be very straightforward, since the areas affected are denoted and enumerated within the Census reports.
A bigger challenge will be deriving statistics for the historic counties on Definition A from the Census reports from 1921 onwards. Census reports from 1921 were based on local government areas. Until the 1960s these were very close to the historic counties in area. Producing statistics from the 1921, 1931, 1951 and 1961 Censuses will require adjustments to the Census report figures based on a comparison of the administrative county / county borough boundaries at that epoch with the Definition A historic county borders. This again will be a straightforward, if more time-consuming, process. The best methodology for producing historic county statistics from 1971, 1981 and 1991 will require further investigation. The 2001 data is available electronically and statistics can be produced in a similar way as for the 2011 Census.
Another aim of the project will be to link historic county statistics derived from Census reports with those derived from the pre-Census era ${ }^{[5,6]}$, the aim being to produce the best available demographic statistics across as long a reach of our history as possible. In this context it may be that Definition B of the Historic Counties Standard, which considers every detached part to be associated with its parent county, is more relevant than Definition A.

Some subjects for study by the project will include:

- Welsh language skills across all Census epochs since 1891, when this first formed part of the Census;
- Scottish Gaelic language skills across all Census epochs since 1881, when this first formed part of the Census;
- Occupation / employment types across all Census epochs from 1841, when an 'Occupation' question was first included;
- Country of birth across all Census epochs from 1841, when data on this was first collected.
- Marital status across all Census epochs from 1851, when data on this was first collected.

The results of the project will be published as downloadable reports and GIS datasets.
